

THE TREASURY OF FINANCIAL KNOWLEDGE

Kuber Map for FIBO

Finance already has a language precise enough to trust.
Here's how an AI agent finally learns to speak it. — **an
illustrated guide.**

**The limits of my language mean
the limits of **my world**.**

— Ludwig Wittgenstein, Tractatus Logico-Philosophicus

Give an intelligence the right language, and you expand what it can safely do. Finance already has that language. It's called **FIBO**.

Every leap in finance began with a shared language.

- 1494** ● **Double-entry bookkeeping**
Luca Pacioli codifies it in print — a shared grammar for value that still underpins every ledger.
- 1973** ● **SWIFT**
Banks agree on one messaging standard so money can move between institutions that don't share systems.
- 2012** ● **The Legal Entity Identifier**
After 2008, regulators couldn't reliably say who was who. The LEI (ISO 17442) gives every entity one global name.
- 2010s** ● **FIBO**
The EDM Council models the *concepts* themselves — loans, securities, owners, reports — as one open, machine-readable ontology.

AND NOW, A NEW PARTICIPANT

Finance has a new decision-maker. It doesn't speak **the language yet.**

Every prior leap gave **people and systems** a shared, precise vocabulary. Today the newest actor on the desk is an **AI agent** — fluent in words, but not grounded in what a mortgage, a beneficial owner, or a regulatory report actually *is*.

The next shared language isn't for humans, or for machines that move money. It's for the machines that now reason about it.

WHERE THIS THOUGHT CAME FROM

I sat in the rooms. On AI, the verdict was **unanimous.**

"We tried GenAI. The demo dazzled. Then it couldn't go near a regulated decision."

— Chief Risk Officer, retail bank

"Honestly? I see noise, not ROI. It sounds confident and gets the details wrong."

— CFO, lending fintech

"If it can't show me *why* it answered, I can't put it in front of a regulator."

— Head of Compliance, asset manager

THE INSIGHT

Fluent is not grounded.

A large language model talks about a mortgage or a beneficial owner convincingly — but **approximately**. In finance, approximately-right is the kind of wrong that passes a demo and fails an audit.

The fix isn't a bigger model. It's grounding — giving the agent the industry's precise, shared, auditable definitions, so every answer can cite its source.

The map is not **the territory**.

— Alfred Korzybski

A wrong map is worse than none. So we drew this one from the source — and **cited every road**.

WHAT THIS IS

Kuber **Map** turns FIBO into grounding an agent **can cite.**

FIBO is rigorous but built for modelers — exhaustive and hard to use directly. **Kuber Map reshapes it** into a teachable map and into portable context packs a financial AI agent retrieves and cites, with a FIBO provenance trail for audit.

Named for **Kubera**, the treasurer and keeper of wealth. Its interactive map is forked from **Bodhi Map** — the open knowledge graph of modern AI — and reimaged for finance.

Three rules we don't break.

01

Teach, don't dump

A hand-picked, learner-first "core" — not the whole ontology firehosed at an expert.

02

Never blur provenance

Every fact is labeled **standard** or **curated**. You always know who is talking.

03

Audit over hype

Every concept carries its FIBO citation, so an answer is traceable — for a reviewer or a regulator.

Value is **measured, not claimed** — and the whole thing is open, MIT-licensed, and free.

HOW IT WORKS

From open standard
to a grounded answer.

**In God we trust. All others must
bring data.**

— W. Edwards Deming

We measured grounding instead of claiming it. **The data is
on the next page.**

THE PROOF — MEASURED, NOT CLAIMED

Same model. Same questions.
One of them is grounded.

+45_{pt}

Accuracy lift

47.5% → 92.8%

97%

Auditable answers

cite a real FIBO IRI — from
0%

0%

**Hallucinated
citations**

down from 55%

Across **263 questions in five financial domains** on gpt-4o-mini, corroborated on the stronger gpt-4o — where the lift **held**. Scored deterministically; no model grading itself.

The more autonomous the agent, the less room to **be wrong**.

Agents chain steps

An agent doesn't answer once — it reasons across many hops. One wrong semantic early poisons the whole chain.

Cross-domain by nature

Real tasks span loans, securities, entities, reports. Grounding must connect domains — exactly what curated bridges do.

No human in every loop

Autonomy removes the reviewer who once caught the confident mistake. The citation trail becomes the control.

Trust is the unlock

Institutions deploy what they can prove. Grounding turns "impressive demo" into "audit-ready system."

THE CONNECTIVE TISSUE

The bridges FIBO leaves unbuilt.

19 curated bridges, each grounded + cited, offered back to the EDM Council. They're what let an agent reason across FIBO's separately-governed domains — and the moat that's hard to copy.

GROUND, END TO END

Five domains. Grounded end to end. **Today.**

● **Loan origination**
underwriting a mortgage

● **KYC & beneficial ownership**
entity resolution

● **Securities**
instruments & issuance

● **Regulatory reporting**
supervisory filings

● **Derivatives**
options, futures, swaps

Each is a curated slice + a context pack — and adding a new one is a **spec-driven JSON file**, no code. Payments, insurance, and ESG are next.

“

**An AI that cannot cite its source
isn't intelligent — it's **confident**.
Finance cannot bank on
confidence.**

— the thesis behind Kuber Map

KEY TAKEAWAYS

Five things worth remembering.

1

The blocker to AI in finance is grounding, not model size.

2

FIBO is the industry's shared language — Kuber Map makes it usable and citable.

3

Grounding is measured: +45pt accuracy, 97% auditable, 0% hallucinated citations.

4

Agentic AI needs it most — chained, cross-domain, autonomous decisions demand a trail.

5

It's open, free, and community-built — try it, use it, contribute to it.

HOW TO USE IT

Explore, or **ground your agent.**

TRY THE LIVE APP – FREE, INSTALLABLE

ai-first-community.github.io/kuber-map

FOR AI TEAMS – USE A CONTEXT PACK

github.com/AI-First-Community/kuber-map/wiki

Scan to open on your phone, or visit on desktop for the full interactive graph. Each use case exports a **ready-to-ground context pack** with an MCP endpoint an agent can call.

BUILD IT WITH US

The best contributions need **no code**.

Add a use case

A curated slice for a real financial task — one JSON file; the tooling verifies every FIBO id.

Propose a bridge

A cross-domain link FIBO doesn't draw, with a rationale + citation — offered back to the EDM Council.

MIT-licensed, CI-gated, and welcoming. Good first issues are open now at github.com/AI-First-Community/kuber-map.

Give AI the **language** of finance.

Kuber Map is open, free, and ready. Explore the map, ground an agent, or add the next use case — and help turn "we tried AI" into "we run on it."

Built on **FIBO** (© EDM Council / OMG) · inspired by **Bodhi Map**, the open knowledge graph of modern AI · MIT-licensed & community-built.
