

Six representative cross-domain relations FIBO doesn't yet draw

From 19 grounded relations surfaced while building learner-first, agent-grounding maps of FIBO across five use cases. Both endpoints are real FIBO/Commons classes; none duplicates an edge FIBO already asserts; each carries a rationale + citation. Shown in a neutral **kmb**: namespace — we identify the **gap**, not the property.

mortgage-backed security **SEC**

backed-by

mortgage **LOAN**

SEC ↔ LOAN Pooled mortgage loans back an MBS; FIBO models both, but draws no edge from the security to the loans that back it. **SEC Regulation AB · 17 CFR 229.1100**

asset-backed security **SEC**

backed-by

loan **LOAN**

SEC ↔ LOAN An ABS is collateralized by a pool of receivables such as consumer or auto loans; the backing relationship is left implicit. **SEC Regulation AB · 17 CFR 229.1100**

reporting party **FND**

identified-by

legal entity identifier **BE**

FND ↔ BE The party that submits a supervisory or transaction report is identified by its LEI; FIBO defines both, but not the link. **ISO 17442 (LEI) · MiFID II / CFTC reporting**

credit default swap **DER**

references

bond **SEC**

DER ↔ SEC A CDS transfers the credit risk of a reference obligation — typically a bond of the reference entity — but FIBO draws no edge from the swap to it. **ISDA Credit Derivatives Definitions**

regulatory report **CMNS**

submitted-to

regulatory agency **CMNS**

INTRA-DOMAIN A report is submitted to the agency that requires it; Commons models both classes but not the filing edge between them. **Supervisory practice · HMDA → CFPB, MiFID II → NCAs**

beneficial owner **BE**

beneficial-owner-of

legal entity **CMNS**

BE ↔ CMNS The party that ultimately owns or controls a legal entity — core to UBO resolution; FIBO models the role but draws no edge to the entity owned. **FATF Recommendations 24 & 25 · 31 CFR 1010.230**
